

Checklist:

Reflect on how your team manages requirements

- We reference a uniform requirements quality guideline when eliciting requirements which reduces time spent reformatting requirements due to low quality
- We use a requirements management tool, which all necessary stakeholders use proficiently, to properly manage requirements
- We have up-to-date links associated with the requirements (and other related artifacts) to establish traceability (horizontal and vertical) throughout the system
- We maintain an up-to-date, reliable traceability metric for the system
- We track requirements to understand what stage of maturity they are in (e.g. new, analyzed, changed)
- We update the implementation statuses of requirements (e.g. to be implemented, implemented, verified) throughout the project duration
- We systematically prioritize requirements activities using attributes (implementation status, type, version, etc.) to increase our efficiency when prioritizing requirement work
- We utilize a requirement review process, that includes all stakeholders, to ensure requirements are approved
- We employ a consistent requirement baselining process that supports our requirements reviews
- We utilize a variant management process that ensures variant differentiations are visible in a clear, organized, and lean manner to optimize reuse

Did you check every box?
Does your team have room for improvement?

INVENSITY is readily available to answer your questions, walk through your current challenges, and provide initial consultations at no-cost.

Collaborating with you and your team, we analyze which requirements management methods and tools are the best options for your business and your project situations and support you in the implementation. Contact us for in-kind services including an in-depth requirements management health check.

Let's get started.
